Financial Markets, Institutions and Instruments

Topic 11: Balance of Payments

MSF Program
Ruttachai Seelajaroen, Ph.D.
Dept of Banking & Finance
Chulalongkorn Business School

Overview

1. Balance of Payments
2. BOP Accounting Principles
3. International Economic Linkages
4. CA and FA Trends in Major Countries

1. Balance of Payments

1.1 Definition

1.2 Components of BOP

1.3 Examples of BOP

▷ Visa > 3 months ⇒ recognized as transaction of Thai resident

▷ But if transfer money back to their home country → exchange btw Thai and foreign country

1.1 A Brief Description of the Subject

- The **balance of payments** or **BOP** is an accounting statement that summarizes all economic transactions between residents of the home country and residents of all other countries over a time period.
- Transactions affecting a country's ^{foreign exchange} FX position are recorded on the BOP, for example,
 - International trades, ^{⇒ Thailand imports or exports goods to foreign countries} <product movement>
 - International investments (portfolio investment and FDI), ^{land deed - claim on land} <capital movement> • capital inflow: foreign buy property ⇒ Thailand lose claims ^{shdr} <debt holder> ^{↳ foreigners have more claim on asset than Thailand} on assets
 - ^{"secondary income"} Unilateral transfers → e.g. foreign teachers send money back to their home country • capital outflow: Thai get claim on foreign asset
- The BOP consists of 3 main accounts.

1.2 Components of BOP

1. Current Account (CA)

- Balance of Trade on goods and services
- Primary income
- Secondary income

2. Capital and Financial Account (FA)

- Net foreign direct investment
- Net portfolio investment (equity and liability)
- Other financial items

X. Net Errors and Omissions

3. Official Reserve Account (RA) = changes in official reserves

Thailand Balance of Payments 2018-21 (USD mio)

3 main accounts

⊕ gain foreign currency

⊖ loss

buy/sell/loan

gain on reserve assets

BOP Components

- **Current Account** records the monetary value of international flows associated with transactions in goods, services, income flows and unilateral transfers.
 - **Goods and services**
 - Receipts/payments on merchandise and service trade
 - **Primary Income**
 - Receipts/payments on investment returns (i.e., dividends, profits and interest)
 - Receipts/payments on employment of non-residents
 - **Secondary Income (Unilateral transfers)**
 - Receipts/payments on money gift or gifts in kind

BOP Components

- Receipts/payments on services include:
 - Travel and tourism
 - Insurance
 - Financial, technical and marketing services
 - Telecommunication
 - Use of property right (royalty and franchise fees)
 - Professional and consulting services
 - Trade transportation
 - Education
- A surplus in CA implies that the nation has transferred more resources (i.e., goods, services) to foreign countries than it has received from them.

BOP Components

- **Capital and Financial Account** records all international purchases or sales of assets, such as, titles to real estate, corporate stocks and bonds, government securities, bank deposits, etc.
 - **Capital transactions** consist of capital transfers (such as debt forgiveness, migrants' goods and financial assets) and the acquisition and disposal of certain nonfinancial assets (such as rights to natural resources, patents, copyrights, trademarks, franchises and lease).
 - ^{- biggest part} **Financial transactions** include financial transactions from private sectors, government and official settlement transactions, excluding changes in official reserves.

BOP Components

- Financial transactions can be classified into 4 types.
 - Direct investment: acquisitions of controlling interest (stock ownership $> 10\%$) in businesses.
 - Portfolio investment: purchases/sales of financial securities (bonds, stocks, etc.)
 - Financial derivatives: purchases/sales of financial derivatives (forwards, futures, options, etc.)
 - Other investments: lending/borrowing in banking systems and in trade credits.
- Normally the balance on capital transactions is very small.

BOP Components

- Official Reserve Account records the change in official reserve assets held at the central bank.
- ^{not HC} Official reserve assets held by central banks include
 - Foreign currencies ✓
 - Gold ✓
 - ^{legacy from Bretton Wood} Special Drawing Rights (SDR) ✓
 - Reserve deposited at the IMF ✓
- Reasons for holding reserve assets:
 - Liquidity purposes
 - Foreign exchange market intervention purpose

2. BOP Accounting Principles

2.1 Recording Transactions to BOP

2.2 Examples

if transaction is qualified as BOP transaction

^t CB record by using double entry book → debit (-), credit (+) with equal amount

2.1 Recording Transactions on BOP

IMF comes up with this method

■ Double-entry bookkeeping

- Each transaction is recorded twice, one as a credit and the other as a debit of an equal amount.
- The BOP bottom line is always zero.

sum of all account must be zero

$$CA + FA + RA \equiv 0$$

- The ^{newspaper} overall balance is sum between CA and FA

$$\text{Overall-Balance} = CA + FA$$

from foreign investors → increase of foreign claim on domestic assets
country more & more in debt

2.1 Recording Transactions on BOP

capital inflow
country receive foreign currency

- **Credit transactions** are those involving the receipt of payments from foreigners and are entered with a **positive sign** to reflect **currency inflows**.

knows resources (goods & services) to foreign

CA • Export, primary/secondary income receipts

FA • Capital inflows

- ↑ foreign claims on domestic assets (loss claims on domestic assets to foreigners)
- ↓ domestic claims on foreign assets (TH sells foreign assets and more foreign currency to TH)

- Capital inflows result in a decrease in net private assets of the country's residents.

same implication

RA • Decreases in official reserves

claim on foreign asset ↓

BOT holds USD → right for Thai CB to buy US assets

→ more \$ → more on claim on US assets

↓ FA record as ⊖

Fed records \$ as debt

2.1 Recording Transactions on BOP

- ^{negative} **Debit transactions** are those involving the making of payment to foreigners. They are entered with a negative sign to reflect currency outflows.
 - Import, primary/secondary income payments
 - Capital outflows
 - ^{sell TH assets first to get money and move out} ↓ foreign claims on domestic assets
 - ^{TH investors have more & more claims on} ↑ domestic claims on foreign assets
 - Capital outflows result in an increase in net private assets of the country's residents.
 - Increases in official reserves

less debt
we become more & more
asset

2.2 Examples credit ⊕

- TH export
 A Thai firm sells rice to a US firm for US\$1 m. The US firm pays for the order by writing a check drawn on its account at a U.S. bank. The Thai firm then places the check at its bank in Bangkok to draw the money. (to convert to THB, use the exchange rate at the time of the transaction)
 export under current account
order bank to make payment to 3rd party

Export (CA)

+\$1 m.

payment

Other investment* (FA)

-\$1 m.

domestic claim on foreign asset

*The deposit of Thai residents with foreign bank ↑

- A Thai firm exports \$1 m. worth of goods to a customer in Malaysia and gives 3 months credit term to the customer.

Export (CA)

+\$1 m.

Other investment* (FA)

-\$1 m.

domestic claim on foreign asset

*A loan given by Thai residents ↑

Example of International Payments

- The U.S. firm opens a deposit account with a U.S. bank.

US Bank

- | | |
|--|--|
| <ul style="list-style-type: none"> Cash \$2 mio | <ul style="list-style-type: none"> Deposit by US firm \$2 mio |
|--|--|

- The Thai firm places the cheque with a Thai bank. Then, the Thai bank draws the money from the US bank.

US Bank

- | | |
|--|--|
| <ul style="list-style-type: none"> Cash \$2 mio
<i>(never move)</i> | <ul style="list-style-type: none"> Deposit by US firm \$1 mio Deposit by TH bank \$1 mio |
|--|--|

TH Bank

- | |
|--|
| <ul style="list-style-type: none"> Deposit by TH firm \$1 mio |
|--|

- Now the Thai bank has more claims over U.S. assets.

most currency use to counterpart is USD

TH bank illiquid

thrs move (claim)

same account

TH bank has claim on US assets

move → outflow !!! → record as ⊖ number

TH bank illiquid TH firm

2.2 Examples

- * Foreign asset with bank account_{TH} → bank is US bank, who is in TH.*
 A Thai investor buys \$1 m. of shares in a company listed on the NYSE, equivalent to less than 10% of the voting rights in the company. The shares are paid for using his bank account in Thailand. *portfolio investment*

Other investment* (FA)

TH claim on deposit in US bank ↓
+\$1 m.

Portfolio investment (FA) **-\$1 m.**

FA TH claim on US asset ↑

*The deposit of Thai bank with foreign bank ↓

- A Thai bank exchanges THB for \$1 m. on the FX market.

Other investment* (FA)

+\$1 m. *foreign claim on TH bank ↑*

Other investment** (FA) **-\$1 m.**

TH claim on deposit with US bank ↑

*The deposit of foreign bank with Thai bank ↑

**The deposit of Thai bank with foreign bank ↑

2.2 Examples

- An expat working in Thailand receives a payment from a Thai company that he works for. *ยังไม่ขึ้นบัญชีกองกลาง: ส่วนเงิน กลับไป: TH*

Not recorded on BOP

- The expat send the money home to support his children's education.

Other investment* (FA)

+\$1 m.

foreign has more claim on TH asset

Secondary income (CA)

-\$1 m.

*The deposit of Thai bank with foreign banks ↓

3. International Economic Linkages

3.1 BOP and Exchange Rates

3.2 CA Deficit and Foreign Indebtedness

3.3 Does CA Deficit Imply a Weak Economy

3.4 Possible Solutions to Chronic CA
Deficits

3.5 CA and FA Trends in Major Countries

Reserve asset > 0
 < 0

3.1 BOP and Exchange Rate

means CB intervene by using RA
a lot of movement to defend currency value

- Under a **fixed rate system**, if the overall balance is not zero ($CA + FA \neq 0$), the central bank will intervene the foreign exchange market using its foreign reserves (RA).
 - If $CA + FA > 0$, the central bank will buy foreign currency causing an increase in foreign reserves ($RA < 0$).
 - trade surplus
 - capital inflow
 - currency becomes stronger → CB buy foreign currency → negative RA
↳ Money supply ↑ → inflation ↑
 - If $CA + FA < 0$, the central bank will sell foreign currency causing a decrease in foreign reserves ($RA > 0$).
 - deficit → HC weaker & foreign currency stronger → sell foreign currency → + RA to not zero
- use RA to gain external balance → has RA is key

3.1 BOP and Exchange Rate

RA = 0

never intervene

- Under a **floating rate system**, the imbalance between CA and FA is automatically eliminated through changes in exchange rate. There is no foreign exchange market intervention (FA = 0).
 - $(X-M) \downarrow \rightarrow$ overall balance goes back to 0
 $\rightarrow HC \uparrow \rightarrow (CI-CO) \downarrow$ bc of exchange rate
 $CA + FA = 0$
 - If $CA + FA > 0$, there will be pressure on the exchange rate to decrease (home currency appreciate). This will automatically reduce the surplus on the overall balance.

$HC \downarrow \rightarrow (X-M) \uparrow \rightarrow$ overall balance goes back to 0
 $(CI-CO) \uparrow$ (capital inflow - outflow \downarrow)
 - If $CA + FA < 0$, there will be pressure on the exchange rate to increase (home currency depreciate). This will automatically reduce the deficit on the overall balance.

1990 → emerging mles → all have CA deficit → start accumulate foreign debts external

3.2 CA Deficit and Accumulation of Foreign Debts

↳ implies that how

rely on foreign capital

- **FA+RA** measures net inflows(+)/outflow(-) of capital (NIC).

$FA + RA > 0 \Rightarrow$ net inflow of capital

$FA + RA < 0$

↳ foreigners have more claim on TH assets

- If $FA + RA > 0$, foreigners claims on domestic assets increase relative to domestic claims on foreign assets.

– This implies an increase in foreign debts.

- If $CA < 0$ (< USA >)

– $FA + RA > 0$

– An increase in the nation's foreign debts.

independent country

♀ saving \$10

world

\$100 (export)

← food + rent

\$120 (import)

* cannot print FC

①. reduction in saving to finance record $RA > 0 \rightarrow$ less & less saving

current account deficit

$CA = -\$20$

②. borrow: capital inflow $< FA > 0$ have obligation to pay in future

} increase in foreign debt

- If $CA > 0$ (< China & Japan >)

– $FA + RA < 0$

– A decrease in the nation's foreign debts.

used to be creditor
, become world's biggest international borrower

The U.S.'s CA and FA, 1976-2016 (U\$ bn)

Source: <https://www.quora.com/How-does-the-US-finance-current-account-deficit-Is-it-sustainable>

The U.S. Net International Investment Positions

US
lend \$30 → \$3
borrow \$50 → -\$5
but US earn return from inv more
-\$20

foreign has more claim on assets in US but US investors has less claim on foreign asset

gap is negative

foreign asset held by US investors

Due to chronic CA deficits, the US has become a net importer of capital causing the U.S. to become the world largest net international borrower. In 2018, the U.S. GDP was around \$20.5 trillion.

3.2 CA Deficit and Accumulation of Foreign Debts

- Fact

- Over 1982-2003, U.S. current account deficits have averaged \$183 billion per year. \$4 trillion worth of assets have been transferred to foreign ownership.
- As of Dec 2022, The U.S. net international investment position was -\$16.12 trillion compared to -\$18.12 trillion at the end of 2021.

The United States Current Account Balance 1980-2014 (billions of US\$)

* US boi primary income 1990:

foreign inv buy US gov bond \Rightarrow low risk \rightarrow low int
but US invest in more risky asset \rightarrow higher return

U.S. Balance-of-Payments, 1980–2014 (billions of dollars)

Year	Merchandise Trade Balance	Services Balance	Goods and Services Balance ^(A)	Income Receipts and Payments Balance ^(B)	Unilateral Transfers Balance ^(C)	Current Account Balance

Source: From U.S. Department of Commerce, Survey of Current Business, various issues.

US Current Account deficit per year is around 3-4% of GDP. It does not seem to be large. However, the US has been experiencing Current Account deficit for a long period of time. This could potentially result in a huge pile of external debt.

good trade
main contributor of trade deficit
more competitive
financial services
US has chronic deficit
consulting services
less competitiveness

3.3 Does CA Deficit Imply Weak Economy?

- bad → if it occurs continuously → accumulate debt
 chronic → crisis
 domestic demand ↑
 there're inv demand
 (can occur during strong economy → not bad thing by itself)
 $FA > 0 \rightarrow CA < 0$
 $RA = 0$ if no intervention
- So far, we described a country's capital and financial flows as responsive to developments in the current account.
 - The process can, and often does, work the other way round.
 - For example
 - BoT increases interest rate (i_{TH}) → $FA > 0$ → THB appreciates → $CA < 0$
trade deficit 1 บาท = 10 บาท
 1 บาท → export ↓, import ↑ → Net export ↓ → CA ⊖
 - A significant GDP growth in Thailand (Y_{TH}) → $FA > 0$ → imports of capital goods ↑ → $CA < 0$
 - Hence, CA deficit is not necessary a sign of weak economy.

3.3 Does CA Deficit Imply Weak Economy?

- From GDP equations

[1] Aggregate Expenditure: $Y = C + I + G + (X - M)$

by household → consumption (points to C)
commercial sector (points to I)
gov (points to G)
foreign sector (points to X - M)

[2] National Income (NI):

$Y = C + T + S$

(want to focus on whatever we produce in country)
Household → use wage to consume, pay tax, and save

- Equate [1] and [2]

current account balance

$X - M = (S - I) + (T - G)$

197

+421

-224

both belong to private sector

labor (owner of human capital) → wage
land (owner of property) → rent
entrepreneur → profit
capital → interest

= Net Private Savings + National Budget Balance

= Overall Savings-Investment Balance

too much *too little*
 If no $(T - G)$ & investment demand > saving → importing capital → create CA deficit

if there's gov; $(T - G)$ can cause CA deficit as well

If have CA deficit problem ⇒ 1) encourage household to save more
 2) gov increases tax or less spending

Increase tax → political suicide

In Thailand we have VAT charge to consumption
↳ original 10% ⇒ 7%

politician doesn't like this
↳ policy encourage people to spend more
bcs when people save more → consume ↓ → GDP ↓

3.3 Does CA Deficit Imply Weak Economy?

- From $Y = C + I + G + X - M$,
 - $C + I + G$ reflects national spending or NS (not in the sense of total output). Thus, we may write, $NI = NS + (X - M)$
 - If $X - M < 0$, then $NS > NI$

- Therefore,

$$NI - NS = X - M$$

- Combine with the result from previous slide

$$NI - NS = X - M = (S - I) + (T - G)$$

The U.S. NP/GDP vs. CA/GDP

3.3 Does CA Deficit Imply Weak Economy?

- Implications:
 - Low (high) rate of saving relative to domestic investment (i.e., a net importer (exporter) of capital) causes CA deficit (surplus).
 - High (low) national spending relative to nation products causes CA deficit (surplus). The excess demand for consumption must be acquired through import.
 - Countries may experience CA deficit during high economic growth.

apart from macro fundamental

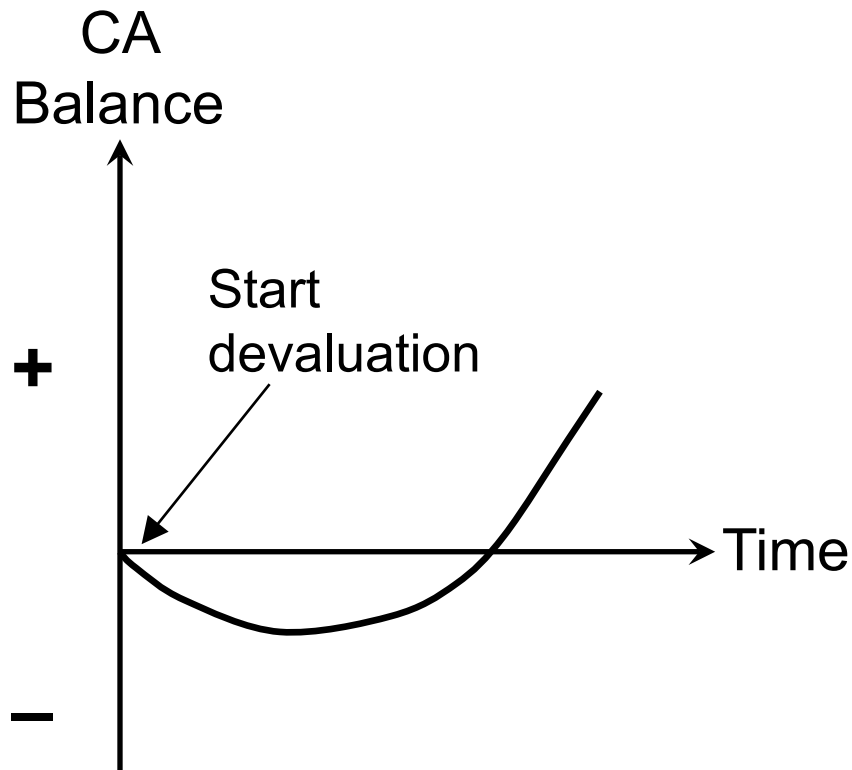

3.4 Possible Solutions to Chronic CA Deficits

- Chronic CA deficit could potentially create problems.
- Possible approaches to solve chronic CA deficit include:
 - Exchange rate policy: Devaluation
 - ↳ encourage export & consume more in the country
 - when oil price ↑ unless permanent change
↳ people aren't willing to change consumption behavior pattern
 - Trade policy: Import tariffs/quotas, Export promotion
 - Directly affect the amounts of imports and exports
 - Improving economic fundamentals
 - Increase aggregate savings relative to domestic investments.
 - Raise national product relative to national spending

3.4 Possible Solutions to Chronic CA Deficits

- Devaluation
 - Devaluation is likely to be ineffective
 - It takes time for changes in currency value to affect value of trade. Why?
 - J-Curve effect: A decline in currency value will initially worsen the deficit before improvement.
 - Why?
 - In longer term, the CA deficit may not be improved even when the lower currency value has taken effect.
 - Why?

The J-Curve Effect

The J-Curve effect argues that devaluation is likely to be ineffective to improve CA balance, especially, in the short-run. This is because consumption behaviors are slow to change. However, in the long-run, foreign competitors have time to improve their efficiency/productivity. Therefore, devaluation may also be ineffective in the long-run.

The U.S. CA Balance vs. the Dollar

3.5 CA and CA Trends in Major Countries

- The following table shows the trend in CA and FA of 5 major countries.
- Since 1994, CH always has CA surpluses. Over the last 10 years, CH has become the net exporter of capital.
- JP has always been running CA surpluses.

CA and FA Accounts of 5 Major Countries

Year	China		Japan		Germany		United Kingdom		United States	
	BCA	BFA	BCA	BFA	BCA	BFA	BCA	BFA	BCA	BFA
1982	5.7	0.6	6.9	-11.6	4.9	-1.5	8.0	-10.4	-11.6	16.6
1983	4.2	-0.6	20.8	-19.3	3.7	-5.7	5.3	-6.2	-44.2	45.4
1984	2.0	-1.9	35.0	-32.9	8.6	-9.1	1.8	-2.8	-99.0	102.1
1985	-11.4	9.0	51.1	-51.6	17.3	-15.0	3.3	-0.7	-124.5	128.3
1986	-7.0	5.7	85.9	-70.7	37.9	-32.4	-1.3	5.0	-147.2	146.9
1987	0.3	4.4	84.4	-46.3	43.3	-21.8	-12.1	32.2	-160.6	151.5
1988	-3.8	6.1	79.2	-61.7	53.1	-68.7	-35.0	39.5	-121.3	125.2
1989	-4.3	3.8	63.2	-76.3	56.2	-53.3	-42.8	34.4	-99.7	125.0
1990	12.0	-0.4	44.1	-53.2	43.6	-36.4	-38.2	38.3	-86.2	88.4
1991	13.3	0.8	68.2	-76.6	-29.6	23.4	-18.7	23.4	-2.3	-3.5
1992	6.4	-8.5	112.6	-112.0	-26.9	64.1	-22.6	20.2	-50.2	46.2
1993	-11.6	13.4	131.6	-104.2	-22.9	8.7	-17.4	18.7	-85.5	86.9
